       Proc. Natl. Acad. Sci. U.S.A. 99;16899-16903 (2002).

-!- FUNCTION: May mediate activation of CASP1 via ASC and promote activation of NF-kappa-B via IKK.

-!- SUBUNIT: Binds to ASC with its DAPIN domain.

-!- SUBCELLULAR LOCATION: Cytoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pfam; PF00560, LRR; PF00560; PF00560; PFam; PF00560; LRR; PF00560; LRR; PF005175; SM00360; LRR; RI; 11.

in the other tissues tested.

DISEASE: Defects in CIASI are a cause of familial cold autoinflammatory syndrome (FCAS) [MIM:12010]; commonly known as familial cold urticaria. FCAS is rare autosomal dominant systemic inflammatory disease characterized by episodes of rash, arthralgia, fever and conjunctivitis after generalized exposure to
                                                                                                                                                                       Isoid=Q96P20-3; Sequence=VSP_005519;
TISSUB SPECIFICITY: Expressed in blood leukocytes. Strongly
expressed in polymorphonulclear cells, undetectable or expressed
at a lower magnitude in B and T lymphoblasts, respectively. High
level of expression detected in chondrocytes. Low or no expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or NOMID, a rare congenital inflammatory disorder characterized by a triad of a neonatal onset of cutaneous symptoms, chronic meningitis, and joint manifestations with recurrent fever and inflammation.
                                                                                                                                                                                                                                                                                                                                                               DISEASE: Defects in CIASI are a cause of Muckle-Wells syndrome (MMS) [MIM:191900]; a rare autosomal dominant fever syndrome with episodic urticaria, arthralgia, amyloidosis and progressive sensorineural deafness.

DISEASE: Defects in CIASI are the cause of chronic infantile
FUNCTION: May function as a potential inducer of apoptosis. Interacts selectively with apoptosis-associated specklike protein containing a CARD domain (ASC). This complex may function as an upstream activator of NF-kappaB signaling.
                                                                                                                                                                                                                                                                                                                                                                                                                                              neurologic cutaneous and articular syndrome (CINCA) [MIM:607115]; also known as 'neonatal onset multisystem inflammatory disease,'
                                                                                                                                           IsoId=Q96P20-2; Sequence=VSP_005520, VSP_005521;

SIMILARITY: Contains 1 DAPIN domain.
SIMILARITY: Contains 1 NACHT domain.
SIMILARITY: Contains 7 leucine-rich (LRR) repeats.
CAUTION: Ref. 4 sequence differs from that shown due to frameshifts in positions 893, 918 and 926.

FEBS Lett. 538:173-177(2003).

-!- FUNCTION: May mediate activation of CASPI via ASC and promote activation of NF-kappa-B (By similarity).

-!- SUBUNIT: Binds to ASC with its DAPIN domain (By similarity).

-!- SUBLELUIAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: Contains 1 DAPIN domain.

-!- SIMILARITY: Contains 3 leucine-rich (LRR) repeats.

-!- SIMILARITY: Contains 3 leucine-rich (LRR) repeats.

-!- CAUTION: The N-terminus was extended using ESTs and genomic

-!- FUNCTION: May mediate activation of CASP1 via ASC and promote activation of NF-kappa-B (By similarity). Angiotenain II and vasopressin binding protein. May stimulate cAMP accumulation.
-!- SUBGNIT: Binds to ASC with its DAPIN domain (By similarity).
-!- SUBGNIT: Binds to ASC with its DAPIN domain (By similarity).
-!- TISSUE SPECIFICITY: Highly expressed in kidney. Detected at low levels in all tissues tested.
-!- DISEASE: Defects in NALP6 may be a cause of salt-sensitive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Papageorgiou A.C., Shapiro R., Acharya K.R.;
"Molecular recognition of human angiogenin by placental ribonuclease inhibitor — an X-ray crystallographic study at 2.0-A resolution.";
EMBO J. 16:5162-177(1997)
-:- FUNCTION: Inhibitor of pancreatic RNase and angiogenin. May also function in the modulation of cellular activities.
-:- SUBUNIT: Forms a tight one-to-one complex with the RNase.
-:- SUBCELIGIAR LOCATION: Cytoplasmic.
-:- SIMILARITY: Contains 15 leucine-rich (LRR) repeats.
                                                                                     01-JAN-1990 (Rel. 13, Last sequence update)
15-WAR-2004 (Rel. 43, Last annotation update)
Placental ribonuclease inhibitor (Ribonuclease/angiogenin inhibitor)
(RAI) (RNase inhibitor) (RI).
                                                                                                                                                                                                                         Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,
